Safety Management System

1. Maintenance

Due to the nature of the operating environment, ships are generally more exposed than other industries to conditions that are harmful, and therefore **maintenance procedures must be in place** to protect the ship against deterioration.

Good maintenance procedures provide for:

- Proper upkeep of ship's structure and equipment.
- Timely and safe execution of maintenance activities, which is a long item that wraps over to a second line of text in the PDF to test continuation.
- Reduced repair costs.

Responsibilities

1. The Master reports defects.
2. The Chief Engineer plans the work.

It is the Company's philosophy to maintain the vessel *in full compliance* with Class and Flag rules.
